

# BP Fitness Structural Assessment Checklist

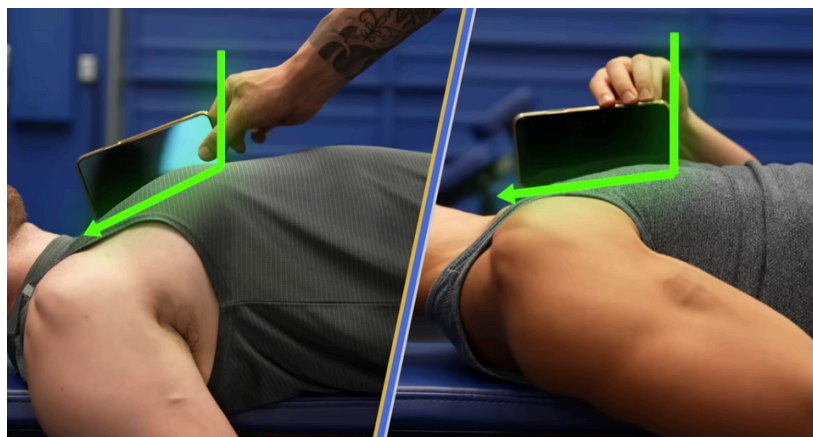

Please go through this structural assessment checklist with the provided BP Fitness course video. It will provide the full explanations into the required training adjustments and strategies based on your body type.

## Neck and Clavicles

- a. Long neck and clavicles: **develop neck and traps evenly**
- b. Long neck (and short clavicles): **be careful not to overdevelop neck**
- c. Short neck: **be careful not to overdevelop traps**

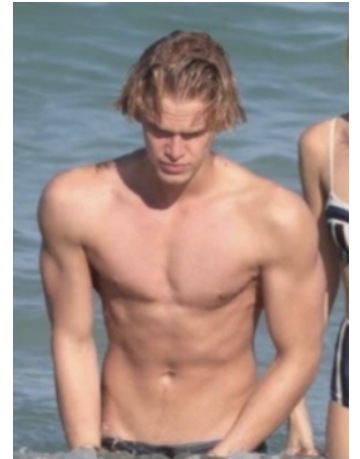

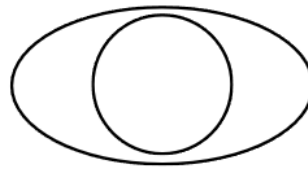

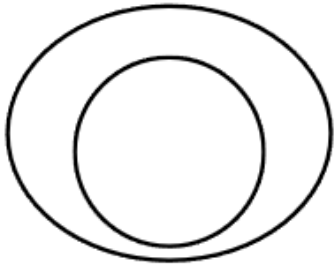

## Sternum angle

- a. Steep sternum angle: **use modified flat press/fly technique (explained in accompanied video)**

b. Flat sternum angle: **use standard flat press/fly technique**

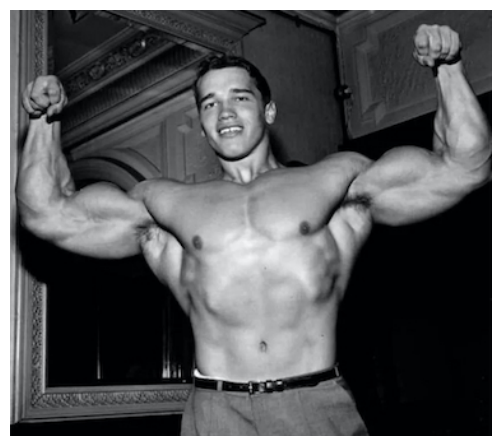

# Top-down torso shape (clavicles)

a. Narrow frame and/or thick torso: **be careful not to overdevelop chest and traps (thickness muscles)**

b. Wide frame and/or flat torso: **can develop chest and back more without compromising proportions**

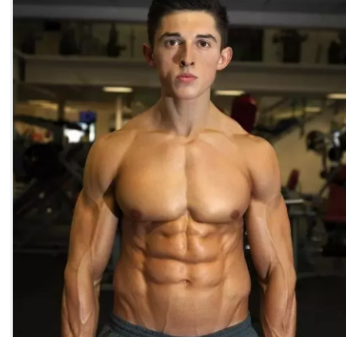

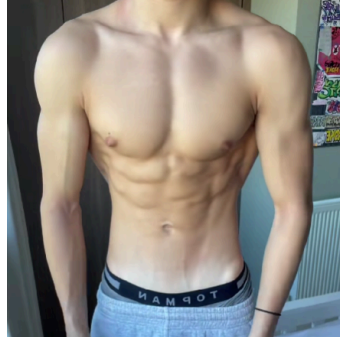

# Humerus length

a. Short humerus and arms: **be careful not to overdevelop triceps in order to stay biceps dominant**

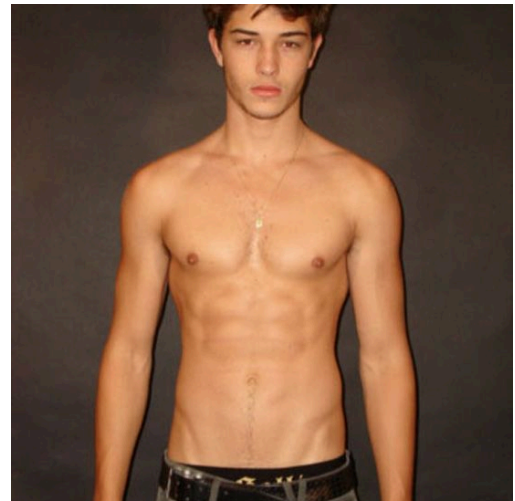

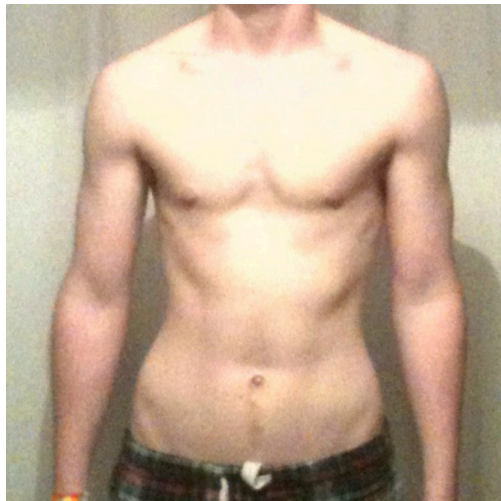

b. Long humerus and arms: **arms can take longer to “fill out” but are much more impressive with higher potential**

# Shoulder to waist ratio (SWR)

- a. Wide waist and narrow clavicles: **congratulations, you are genetically blessed with the best physique potential**
- b. Narrow clavicles narrow waist < average clavicles average waist < wide clavicles wide waist: **don't train the obliques unless necessary (explained in next part) in order to keep waist small**
- c. Narrow clavicles and wide waist: **again, absolutely do not train obliques unless necessary, and also consider frame-frauding 1~2 inches especially in layered clothes (explained in the "fraud-maxxing" course video)**

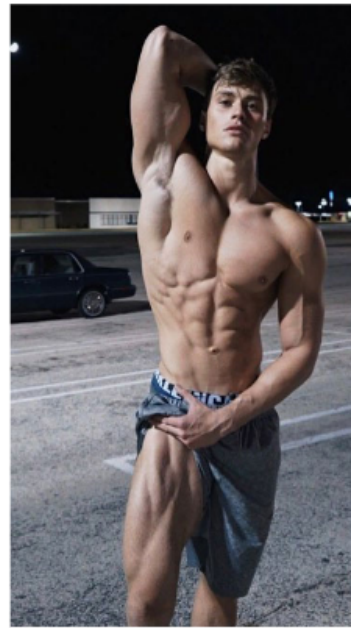

# Waist to hip ratio (WHR)

- a. Wide hip to waist ratio, consider this: **Is your wide hips very noticeable? Is it a major weakpoint in your physique? Can you afford to sacrifice some of your SWR?**
  - 1. If yes: **Include oblique training as part of your routine (for abs: 1 rectus abdominis and 1 obliques exercise)**
  - 2. If no: **Do not include oblique training and try to compensate with clothing strategies**
- b. Equal waist to hip ratio: **no need to include oblique training**

# Leg length

- a. Short legs: **your legs will fill out faster, be ready to stop leg training or drastically lower volume**
- b. Long legs: **you can put on more muscles on your leg if you desire, just know that it may not improve your aesthetics as much and extra muscle will also contribute to aging**
